

Fact Sheet 2

Pest, disease and weed surveillance

Surveillance for your industry's priority unwanted pests should be incorporated into your normal passive surveillance/monitoring activities. These records may be important for export market access.

- Becoming familiar with common pests on your property means that your spray applications or alternative treatment methods can be used with maximum efficiency.
- Routine checking of crops is essential for maintaining crop health and gives you the best chance of identifying a new pest before it becomes established.
- It is important to know the common pests, diseases and weeds in your area and especially those that are often found on your property.
- Consult with other growers on anything suspicious.

Common symptoms of Pest infestation or plant disease include:

- Stem or leaf wilt
- Leaf chlorosis or mottling
- Puncture wounds, chew marks or tunnelling tracks in leaf tissue
- Reduced fruit or vegetable size and reduced crop yield
- Underdeveloped root systems
- Pale fuzzy or powdery growth on leaves, indicating mildew
- Decayed roots, leaves, stems, fruit

- ✓ Record the symptoms or weed and photograph
- ✓ Record the location and restrict access of site(s) workers and equipment to that zone
- ✓ Wash hands, clothes and boots that have been in contact with affected plant material or substrate

- ✓ Do not move the affected plant – incorrect handling could further spread the pest
- ✓ Identify equipment and machinery that have recently been used in the affected zone and decontaminate

Routine Monitoring Pest, disease and weed surveillance

What information should be recorded?

- Record the date and all observations, such as pests identified, growing area affected, the level of infestation and proposed treatment plans.
 - Also record if no pests are detected.
 - A list of biosecurity pests that may impact tomato growers if they appear in New Zealand can be found at Tomatoes New Zealand Inc. www.tomatoenz.co.nz/industry/biosecurity

Pest Surveillance Record Sheet

NB: Level of infestation or infection may be estimated (e.g. low/med/high) or quantitatively (e.g. % plants affected per block/ number plant affected per block). When treatment is commenced, include date of initiation and duration of plan. If a pest, disease or weed cannot be identified, record the symptoms and treat the detection as an unwanted pest.
